Are 5G solar container communication stations still under construction

Overview

How many 5G base stations will China build in 2025?

China plans to construct over 4.5 million 5G base stations in 2025 while introducing additional policy and financial incentives to support industries expected to shape the next decade, the country's Ministry of Industry and Information Technology (MIIT) announced during its annual work conference.

Can we predict 5G base stations by 2030?

We linked these provincial base stations with provincial Gross Domestic Product (GDP), population (POP), and big data development level (BDDL) and established a statistical model to predict 5G base stations by 2030. The model predicted 2-5 million 5G base stations by 2030, considerably lower than the business-projected base station number.

How many 5G base stations are there?

These predicted station numbers are considerably smaller than the business-projected 6-million stations, even for the BDDL = 100 % case under the S2 scenario that yielded the number of 5G base stations at 5.03 million, still one million smaller than the business-estimated 5G base stations. This number, however, is implausible.

Will 5G Revolution & 6G innovation be a priority next year?

The move comes as the country charted its vision for industrial growth during a two-day work conference of the Ministry of Industry and Information Technology. With 4.19 million 5G base stations already in operation, the industry regulator said that "promoting 5G revolution and 6G innovation will be one of the priorities" next year.
