How to optimize a base station's energy consumption?

The base station's average energy consumption during a certain time period has been estimated. A range of optimization approaches, namely PSO, ABC, and GA, have been employed to obtain the best possible (optimal) cost for the system.

What is the power consumption of a BS?

In the operation state, it is believed that power consumption is  $(P_{OS})$ . The BS will keep running until there are no more CRs on the BS. Once the BS becomes empty, it will switch to sleep mode.  $(P_{SM1})$  and  $(P_{SM2})$  are the power consumed when the device is in sleep modes 1 and 2 respectively.

Are PSO & ABC a good optimization technique?

Compared to certain other optimization techniques, PSO, ABC, and GA are comparatively easy to implement. They are usable by users of different skill levels due to their simple ideas and intuitive parameters. They don't require much changes to be applied to a variety of optimization situations.

Is PSO a profitable approach to determining the ideal cost?

Thus, we can use any strategy to determine the ideal cost; nevertheless, as we juxtapose for the proposed framework, PSO is a highly profitable approach for determining the best feasible cost. It is simple to configure, performs admirably in global queries, and is insensitive to scaling changes in design variables.
