Base station second-life battery price

Overview

How much does a second life battery cost?

Market prices ranging from 44 to 180 USD/kWh are suggested for second life batteries in order for SLB to be an affordable option. The second life ageing need to be further investigated in order to ensure that SLB is feasible from an economic and environmental perspective.

Are second-life batteries a viable alternative to stationary batteries?

This story is contributed by Josh Lehman, Relyion Energy Second-life batteries present an immediate opportunity, the viability of which will be proven or disproven in the next few years. Second-life batteries can considerably reduce the cost as well as the environmental impact of stationary battery energy storage.

What is the SoH of a second life battery?

These findings further strengthens the widespread assumption found in the literature review that batteries intended for a second life application should have a SOH of at least 80 percent. The base case 1A resulted in a lower LCOS than the base case for 2A.

Are second-life batteries the future of energy storage?

The potential for second-life batteries is massive. At scale, second-life batteries could significantly lower BESS project costs, paving the way for broader adoption of wind and solar power and unlocking new markets and use cases for energy storage.
