# **Compensation for wind and solar complementary construction of solar container communication stations**

## Overview

---

Under the goal of global carbon reduction, hydropower-wind-photovoltaic complementary operation (HWPCO) in the clean energy base (CEB) has become the key to achieving a high-quality clean energy.

What is the complementary coefficient between wind power stations and photovoltaic stations?

Utilizing the clustering outcomes, we computed the complementary coefficient  $R$  between the wind speed of wind power stations and the radiation of photovoltaic stations, resulting in the following complementary coefficient matrix (Fig. 17.).

Do wind power and photovoltaic stations complement each other?

Typically, wind power and photovoltaic stations are situated at different locations, necessitating the study and analysis of wind speed-radiation complementarity across various regions. This study focuses on wind power stations and photovoltaic stations in Qinghai and Gansu provinces to explore their complementarity.

Do wind and PV power compensate hydropower?

(4) In the compensation relationship of W-PV-H system with medium-long-term, wind and PV power have energy compensation benefits for hydropower. After wind and PV power compensate hydropower, the power generation ability of hydropower has been improved, and the unstored power of reservoir has been increased.

Does PCC reflect the complementarity between PV and wind power?

Miglietta et al. (2017) estimated the complementarity between PV and wind power in the whole Europe by using PCC. PCC reflects the complementarity of RESs to a certain extent, but it can only reflect the linear correlation between two random variables (Bertsekas and Tsitsiklis 2008).

## Compensation for wind and solar complementary construction of so

---

Utilizing the clustering outcomes, we computed the complementary coefficient  $R$  between the wind speed of wind power stations and the radiation of photovoltaic stations, resulting in the following complementary coefficient matrix (Fig. 17.).

At present, most hydro-wind-PV complementation in China is achieved by compensating wind power and PV power generation by regulating power sources, such as a ...

Widen (2011) used Spearman rank correlation coefficient (SRCC) to analyze the complementary characteristics of wind and solar energy for different time scales in Sweden. ...

Further, based on the model group for quantifying contributions and the compensation

electricity contribution value, this paper proposes the benefit compensation ...

What is the complementary coefficient between wind power stations and photovoltaic stations? Utilizing the clustering outcomes, we computed the complementary coefficient  $R$  ...

Optimization and improvement method for complementary power generation capacity of wind solar storage in distributed photovoltaic power stations

Hydropower compensating for wind and solar power is an efficient approach to overcoming challenges in the integration of ...

A measure of wind-solar complementarity coefficient  $R$  is proposed in this paper. Utilizes the copula function to settle the Spearman and Kendall correlation coefficients ...

Building wind and solar complementary communication base stations Optimization Configuration Method of Wind-Solar and · 5G is a strategic resource to ...

Hydropower compensating for wind and solar power is an efficient approach to overcoming challenges in the integration of sustainable energy. Our study proposes a multi ...

The intermittency, randomness and volatility of wind power and photovoltaic power generation bring trouble to power system planning. The capacity configuration of integrated ...

The Kendall CC, Spearman CC, and fluctuation coefficient are combined to construct a comprehensive measure of the complementarity between wind speed and radiation, which ...
