Are battery energy storage systems a fire hazard mitigation strategy?

The challenges of providing effective fire and explosion hazard mitigation strategies for Battery Energy Storage Systems (BESS) are receiving appreciable attention, given that renewable energy production has evolved significantly in recent years and is projected to account for 80% of new power generation capacity in 2030 (WEO, 2023).

Can a lithium-ion battery energy storage system detect a fire?

Since December 2019, Siemens has been offering a VdS-certified fire detection concept for stationary lithium-ion battery energy storage systems.\* Through Siemens research with multiple lithium-ion battery manufacturers, the FDA unit has proven to detect a pending battery fire event up to 5 times faster than competitive detection technologies.

What is the fda241 fire protection system?

The FDA241 is the ideal solution for early detection of electrical fires. In addition to controlling the automated extinguishing system, the fire protection system triggers all other necessary battery management system control functions.

Is Bess a reliable energy storage solution?

One of the robust and reliable solutions for this imbalance is BESS, which can be used to store energy generated during low demand for use during high demand periods. In the US, the cumulative BESS capacity has increased since 2015, with 11.9 GW installed in 2024 (Martin et al., 2025).

As its name implies - "aspirated" smoke and off-gas detection systems use an "aspirator" mounted in a detector unit. The detector connects to a sample pipe network mounted within the area or object being protected. Using the suction from the aspirator, air is continuously sampled and transported to the detection chamber for analysis for particles
