# Energy storage equipment is placed in the basement

## Overview

What is an energy storage system?

An energy storage system is something that can store energy so that it can be used later as electrical energy. The most popular type of ESS is a battery system and the most common battery system is lithium-ion battery.

Where should the energy storage system be located?

All Energy Storage System installations shall be located at the same storey as the fire engine accessway/ fire engine access road. c. The allowable Maximum Stored Energy for the various battery technologies in each compartment shall be as listed in Table 10.3.1. a It shall refer to an aggregated stored energy capacity per compartment.

Can a battery energy storage system be installed outside?

Outdoor installation can include an outbuilding not intended for habitation, detached or separated by a main wall with a minimum fire performance of REI 120 to BS EN 13501. If a battery energy storage system (BESS) is installed on the external wall of a building, it should not compromise the fire performance of the external wall.

How important is battery location in residential ESS deployment?

In residential ESS deployment, battery location isn't an afterthought—it's an operational variable with direct impact on system safety, energy efficiency, and serviceability. Improper installation locations can result in:
