Four-terminal power station generator

Overview

What is a terminal voltage rating for a power plant generator?

Terminal voltage ratings for power plant generators depend on the size of the generators and their application. Generally, the larger the generator, the higher is the voltage. Generators for a power plant serving an installation will be in the range from 4160 volts to 13.8 kV to suit the size of the unit and primary distribution system voltage.

What is a 4 pole DG generator?

Our BRUSH™ Power Generation 4-pole DG generators are designed to be driven by gas or steam turbines with outputs of 10-55 MVA (@40C). With over 750 active installations, they are regularly specified by leading geothermal, public utility, cogeneration (CHP), industrial, and offshore operations.

How much power does a 4-pole generator have?

Covering the power range from 60 to 85 MVA at voltages from 3 to 15 kV, the new 4-pole generators enable higher unit powers and more economical genset designs. Advances in manufacturing technology - resulting from ABB's R&D work - have made it possible to increase the power levels of the proven AMS 4-pole generator platform.

What size generator should a power plant have?

Generators for a power plant serving an installation will be in the range from 4160 volts to 13.8 kV to suit the size of the unit and primary distribution system voltage. Generators in this size range will be offered by the manufacturer in accordance with its design, and it would be difficult and expensive to get a different voltage rating.
