Greenhouse solar curtain wall

Overview

What is a greenhouse curtain system?

The greenhouse curtain system is an essential component of the greenhouse facility, designed to optimize the growing environment for plants. The system is available in both manual and automatic options, and is designed to effectively control light, temperature, and humidity levels within the greenhouse.

Do greenhouse curtains save energy?

Since 70 to 80% of greenhouse heating occurs at night, growers can realize substantial energy savings by using thermal curtains at night. Some growers have saved 30 to 50% on their heating bills. In addition, growers who also use curtains for shading during the summer months may also save on electricity due to reduced cooling loads.

How much space does a curtain system need for a greenhouse?

If you are building a greenhouse and plan to install a curtain system in the future, keep in mind that a curtain system requires approximately 12 inches of unobstructed vertical space, referred to as the travel envelope.

How can insongreen's greenhouse curtain system be customized?

INSONGREEN's greenhouse curtain system can be customized to meet the unique needs of each grower, including size, curtain fabric type, and automation requirements, ensuring that the ideal growing conditions are maintained for plants.
