Overview

What is a shipboard emergency generator?

Shipboard emergency generators provide power for critical systems such as emergency lighting, communication, and restarting the ship's plant during main power failures. These generators are designed to function under maritime conditions and are typically rated at 750 kW with the ability to handle a 25% overload for two hours.

What type of generator does a ship use?

Additionally, large ships often have diesel-powered generators to serve as backup, providing a dependable power source in emergencies, safeguarding both crew and vessel operations. Diesel-driven emergency generators are the most common type used on ships.

Do commercial ships need generators?

By running only the number of generators needed to meet the current load, the vessel can operate its power plant at optimal efficiency, saving fuel and reducing wear and tear. Emergency Power: In addition to the main generators, all commercial ships are mandated to have a smaller, independent emergency generator.

What types of emergency generators are used on ships?

Diesel-driven emergency generators are the most common type used on ships. These generators operate using diesel fuel, which is stored onboard, providing a reliable and consistent power source during emergencies.
