# **High and low temperature requirements for energy storage batteries**

## Overview

---

What is a good storage temperature?

High temperature (45°C) storage for 7 days, charge and discharge energy recovery rate should not be less than 95%. a. Room temperature (25°C) storage for 28 days, charge and discharge energy recovery rate should not be less than 99%. b.

Why do we need a battery energy-storage technology (best)?

BESTs are increasingly deployed, so critical challenges with respect to safety, cost, lifetime, end-of-life management and temperature adaptability need to be addressed. The rise in renewable energy utilization is increasing demand for battery energy-storage technologies (BESTs).

Are battery energy-storage technologies necessary for grid-scale energy storage?

The rise in renewable energy utilization is increasing demand for battery energy-storage technologies (BESTs). BESTs based on lithium-ion batteries are being developed and deployed. However, this technology alone does not meet all the requirements for grid-scale energy storage.

What factors limit the electrochemical performance of batteries at low temperatures?

At low temperatures, the critical factor that limits the electrochemical performances of batteries has been considered to be the sluggish kinetics of  $\text{Li}^+$ .<sup>23,25,26</sup> Consequently, before seeking effective strategies to improve the low-temperature performances, it is necessary to understand the kinetic processes in ASSBs.
