How many panels are installed on the solar roof

Overview

How many solar panels can fit on a roof?

To calculate how many panels you can fit on your roof, start by determining the total area of your rooftop that's suitable for solar installation. Subtract any areas that are not usable due to obstructions like chimneys, vents, or shaded regions. With the usable space in mind, consider the size of the solar panels you are interested in.

How many panels can be installed on a roof?

In this computation, each panel takes up about 1.239-1.44 sq. m of space. Hence, you can set up a maximum of 12 to 15 panels for a 19.72 sq. m of roof space. You need to round your number lower instead of higher if your computations do not result in a whole number.

What is a solar panel calculator?

Our solar panel calculator helps you determine how many solar panels can be installed on your roof and how much electricity they can generate. It calculates the maximum number of panels that fit on the available roof surface, taking into account important factors such as orientation, inclination, and panel type.

Where should solar panels be installed?

We strongly recommend installing the solar panels in an obstruction-free spot and on a south-facing roof with a 40-degree pitch. If this is not feasible, you could still obtain money from panels assembled in other directions or on other roof types. You only need to multiply the measurements of each wall to acquire the total size of your house.
