Lead-acid battery specific energy

POWER UP INDOORS&OUTDOORS

Overview

What is a lead acid battery?

Lead-acid batteries may be flooded or sealed valve-regulated (VRLA) types and the grids may be in the form of flat pasted plates or tubular plates. The various constructions have different technical performance and can be adapted to particular duty cycles. Batteries with tubular plates offer long deep cycle lives.

How do lead-acid batteries work?

In this process, electrical energy is either stored in (charging) or withdrawn from the battery (discharging). There are two general types of lead-acid batteries: closed and sealed designs. In closed lead-acid batteries, the electrolyte consists of water-diluted sulphuric acid. These batteries have no gas-tight seal.

Are lead-acid batteries a good choice for energy storage?

Lead-acid batteries have been used for energy storage in utility applications for many years but it has only been in recent years that the demand for battery energy storage has increased.

What happens when you charge a lead-acid battery?

When discharging and charging lead-acid batteries, certain substances present in the battery (PbO_2 , Pb , SO_4) are degraded while new ones are formed and vice versa. Mass is therefore converted in both directions. In this process, electrical energy is either stored in (charging) or withdrawn from the battery (discharging).
