## Overview

---

What standards are required for energy storage devices?

Coordinated, consistent, interconnection standards, communication standards, and implementation guidelines are required for energy storage devices (ES), power electronics connected distributed energy resources (DER), hybrid generation-storage systems (ES-DER), and plug-in electric vehicles (PEV).

What are the different storage requirements for grid services?

Examples of the different storage requirements for grid services include: Ancillary Services – including load following, operational reserve, frequency regulation, and 15 minutes fast response. Relieving congestion and constraints: short-duration (power application, stability) and long-duration (energy application, relieve thermal loading).

Can tripping a high level of inverter based systems cause stability problems?

As low frequency is the result of insufficient generation, tripping a high level of inverter based systems would contribute to the problem and cause possible stability issues in response to a relatively minor disturbance. Appropriate interconnection standards, smart grid devices, and storage are all key elements of the solution.

Can grid-forming inverters be integrated?

r system operation with grid-forming (GFM) resources. In some cases, those requirements may not be appropriate for or ay even inadvertently limit the use of GFM resources. The UNiversal Interoperability for grid-Forming Inverters (UNIFI) Consortium is addressing funda-mental challenges facing the integration of GFM inverters in elec
