## Overview

---

How do high frequency inverters produce a sine wave output?

To produce a sine wave output, high-frequency inverters are used. These inverters use the pulse-width modification method: switching currents at high frequency, and for variable periods of time. For example, very narrow (short) pulses simulate a low voltage situation, and wide (long pulses) simulate high voltage.

What type of inverter is used to produce a sine wave?

Combination of pulses of different length and voltage results in a multi-stepped modified square wave, which closely matches the sine wave shape. The low frequency inverters typically operate at ~60 Hz frequency. To produce a sine wave output, high-frequency inverters are used.

What is the output frequency of a high-frequency inverter?

The output frequency of the high-frequency inverter is much higher than the power frequency, usually between a few kilohertz and tens of kilohertz.

What is the difference between low frequency and high frequency inverters?

The low frequency inverters typically operate at ~60 Hz frequency. To produce a sine wave output, high-frequency inverters are used. These inverters use the pulse-width modification method: switching currents at high frequency, and for variable periods of time.
