Power transmission sequence of uninterruptible power supply for mine

Overview

What are uninterruptible power supplies (UPS)?

Uninterruptible power supplies (UPS) are not a new technology but over recent years their application to the mining industry has increased in terms of volume and rated power. UPS installations come in various shapes and sizes that are specific to each application and the associated electrical installation.

What happens if a power supply fails?

Power failures can result in costly production losses and can also cause severe damage. The power supply devices, DC/DC converters, redundancy modules, and uninterruptible power supplies from Phoenix Contact reliably supply your systems. Their scope of functions and design are perfectly tailored to the demands of the mining industry.

Who designs mining power systems?

Traditionally, mining power systems have been designed by engineering companies (EPCs) and/or mining sector end-users using their knowledge of the industrial process and their experience from previous projects.

How to create a redundant power supply system?

A redundant power supply system is created by connecting two power supply units in parallel. Optimize this solution with the active redundancy modules and the diode modules to maximize system availability. The QUINT ORING modules permanently monitor the input voltage, the output current, and the decoupling section.
