## Overview

---

Why do solar PV modules need a DC-DC converter?

The major issue of solar PV modules is low supply voltage which is increased by introducing the wide input voltage DC-DC converter. The merits of this introduced converter are low-level voltage stress on diodes, good quality supply power, high voltage gain, plus low implementation cost.

Do solar panels integrate power optimizers and solar panels?

While many people install power optimizers and panels as separate components, your installer may recommend a solar panel that integrates both components into one, also known as a smart module. What are smart modules?

Smart or DC-optimized modules are solar panels with an integrated DC power optimizer.

Do solar panels need a central inverter?

Many solar companies recommend pairing a solar array with power optimizers and a central inverter to enhance the performance of a solar panel system. While many people install power optimizers and panels as separate components, your installer may recommend a solar panel that integrates both components into one, also known as a smart module.

What size solar system does Powerwall 3 support?

20 kW DC is the absolute maximum solar system size that Powerwall 3 can support. Powerwall 3 has a boosting feature that can send 5 kW of DC power continuously from solar to the battery at the same time that up to 11.5 kW / 48 A of solar is inverted to AC power, leading to a potential total DC power of 16.5 kW.
