**Store energy at night and use
electricity during the day**

Overview

Environmental-friendly solar energy combined with lithium battery energy storage makes household electricity usage more cost-effective, environmentally friendly and reliable - store sunlight during the day and use it for free at night, saying goodbye to electricity cost worries and power outages. What is energy storage & how does it work?

Energy storage ensures electricity availability even when solar panels stop producing. During the day, excess energy from photovoltaic systems gets stored in batteries or fed into the power grid. Storage capacity depends on the system's design and the energy needs of the space it supplies.

Why should you use solar energy at night?

Utilising stored solar energy at night offers several advantages. It ensures an uninterrupted power supply, critical for maintaining comfort and security. It also reduces dependence on the electricity grid, leading to potential cost savings on energy bills.

Why do solar panels use batteries at night?

If connected to the grid, surplus energy produced during the day contributes to shared distribution and offsets nighttime usage. Batteries play a critical role in maintaining solar energy reliability at night. They store direct current (DC) electricity converted by solar panels during peak production hours.

Why do solar panels operate differently during the day and night?

Solar power operates differently during the day and night due to sunlight availability. While energy production is active during the day, nighttime relies on stored or grid-supplied power for uninterrupted operation. During the day, solar panels generate electricity by absorbing sunlight through photovoltaic (PV) cells.
