What did Spain's Council of Ministers report on the Iberian blackout?

Update 18 June 2025: Spain's Council of Ministers yesterday released preliminary findings and recommendations based on its ongoing inquiry into the 28 April 2025 Iberian blackout. The findings note some unusual voltage oscillations across the grid in both the days preceding and during the morning of the blackout.

Why did Spain and Portugal shut down in 2025?

On Ap, the entire electrical system of Spain and Portugal shut down. Apart from the islands, which operate on separate grids, both countries — as well as parts of southern France connected to the Iberian network — were plunged into darkness. This was one of the most significant blackouts in the history of the European grid.

How does Spain's blackout affect low-inertia power systems?

Such testing practices improve the system's capacity to contain localized disturbances and prevent cascading failures, especially in grids dominated by inverter-based resources. Spain's April 28th, 2025 blackout underscores the vulnerability of modern low-inertia power systems to both overfrequency and underfrequency events.

Should electrical storage be increased in Spain?

In its report, the Spanish government also recommends “boosting electrical storage” for “increased strength and flexibility of the electrical system.” (page 151; this and all subsequent quotes translated via Google Translate, in some cases with non-substantive corrections)
