Overview

What is voltage fluctuation arising from PV systems?

Passey et al. have categorised the term 'voltage fluctuation' arising from PV systems into: voltage imbalance (three phase voltage), voltage rise leading to reverse power flow (load side voltage larger than the upstream voltage) and power output fluctuations (due to PV variability).

What causes voltage fluctuation?

The main causes of voltage fluctuation are pulsed-power output, resistance welders, start-up of drives, arc furnaces, drives with rapidly changing loads, and rolling mills. Flicker. Flicker (Fig. 1.12) has been described as "continuous and rapid variations in the load current magnitude which causes voltage variations."

Why is voltage fluctuation a major power quality problem?

Voltage fluctuation is considered as a major power quality problem. It can affect motor starting, speed and causes disturbances to the applications driven by the affected motors which can lead to equipment temperature rise and motor overloading. Therefore, it affects the production, machine service life and thus increases economic losses.

Are voltage fluctuations the main power quality issue when PV systems are integrated?

It has been clearly identified and well demonstrated that voltage fluctuations are the main power quality issue when PV systems are integrated into electricity networks [22-24,26,29,33,47,64-70].
